(54) Title: LIGHTING DEVICE

(57) Abstract: The present invention relates to a lighting device including at least a light source (LS) for emitting light rays and means for guiding said light rays on a projection plane (PP). The guiding means are formed by a lens (OD) presenting a cylindrical portion (CYL) extending along an axis (AX) perpendicular to said projection plane and at least a convex shaped surface (CSH) extending at an extremity of said cylindrical portion. The convex shaped surface is adapted to direct a portion of the light rays emitted from said light source towards said projection plane.. The invention enables to project the light towards a projection plane quasi parallel to the beam direction without using any guiding means on the projection plane itself. This solution is consequently relatively compact.
